Novartis campus
An inspiring environment
to foster innovation

We are transforming the Novartis global headquarters campus to be an **attractive, high-performance workplace** to create high-quality medicines for patients.

Healthcare is a dynamically changing industry driven by knowledge and innovation; in this challenging environment, we must adapt the way we work and **encourage collaboration** to fulfill our mission of caring and curing.

Our associates bring a spirit of innovation to **addressing patient needs** – we are committing this same spirit to creating the Novartis campus.

To address patient needs

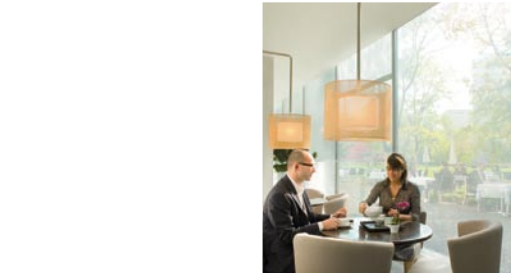

Novartis aspires to be the most respected and successful healthcare company. Success in this challenging industry is based on continuous advancement. As healthcare needs increase globally, we must encourage innovation to provide new and better medicines to patients.

To encourage collaboration

Inspiring working environments have concrete business benefits. The multi-space work area concept enhances communication and effectiveness. Indoor and outdoor common spaces are designed to promote interaction between associates, improving teamwork and knowledge-sharing.

To provide an attractive workplace

We are using best-in-class architecture and design to create a state-of-the-art workplace to attract and retain the best talent worldwide. Campus is a car-free, non-smoking area providing a healthy environment. Public green areas, cafés and restaurants, shops and the fitness center offer a vibrant environment for associates from more than 80 countries.

Our approach

Environmentally responsible

We are taking an environmentally-responsible approach to campus development, prioritizing recycling and using advanced technologies. Efficient energy supplies are a prerequisite for new campus buildings, minimizing future environmental impact.

Future oriented

Campus development is a long-term project. Office spaces are designed based on research into inspiring working environments. We are creating modern labs to keep pace with advancing science and technology, enabling drug discovery.
